Rootstock Swaps on Boltz

What is **Boltz**?

- Non-Custodial Bitcoin Bridge
- Swap between different Bitcoin Layers
- Public API with numerous integrations
- Running since 2019, one of the oldest and largest Lightning nodes

Why?

Lower Entry Barrier

+ Fast: Seconds
+ Easy: Phoenix/Metamask
+ Explore: Suitable for small amounts

Existing Bridges to Bitcoin are **slow & expensive**

- Slow: hours
- Expensive: mainchain fees
- Trusted: FastBTC

-> Not suitable for “exploring Rootstock”

Vision: Bridging Bitcoin layers

L2 ⚡ Rootstock LIQUID NETWORK

L1 bitcoin

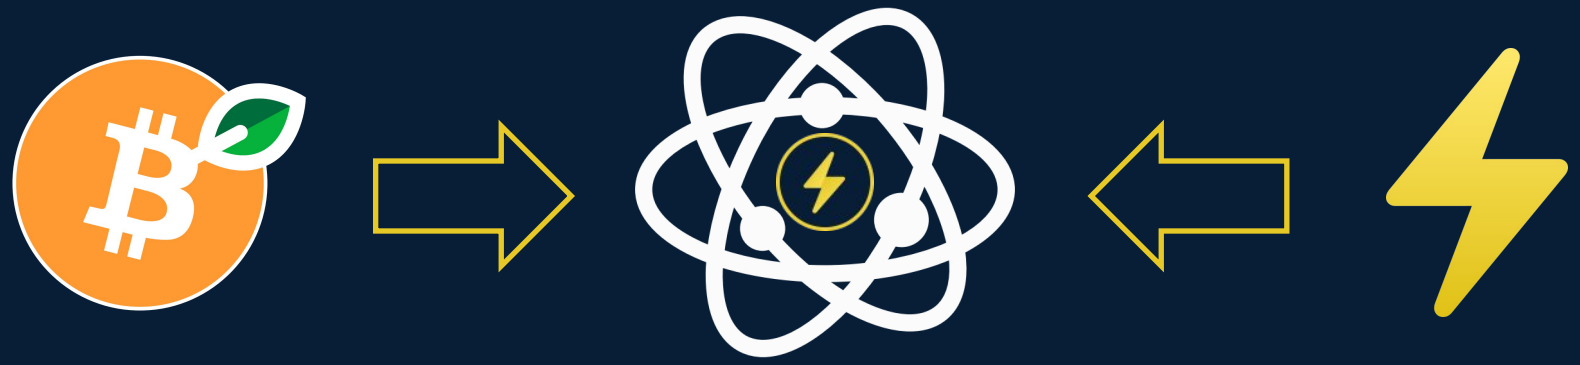
How?

Lightning: Connecting Bitcoin Layers

Other Layers like Liquid, Mainchain

Non-Custodial: Atomic Swaps

+ Only way to avoid a disaster
+ Only way to enable reasonable privacy for users
+ Only way to not require KYC



Rootstock Integration Highlights

- By integrating RIF Relay, we avoided the major downside of the user having to have RBTC in order to get RBTC...
- Compatibility with all other layers at Boltz: Liquid, mainchain

Ecosystem

Native integration with projects via our API
