

Brewing 🍺 @ Boltz

Use cases for USDT integration

- Fund your lightning channels from the USDT you already have on Binance, Kraken, and other centralised exchanges.
- Hedge yourself against short term Bitcoin volatility or simply take profit.

Ether Integration 🎉

- Boltz will soon add Ether in the next release. This is fully native cross chain swap. No wrapped asset and no custodial tradeoffs.

No Ether required to claim

- Boltz prepay miner fee protocol would allow for users to trade Ether without having any Ether in the wallet. This improves one of the main UX hurdle that Web3 users have to deal with.

Chain to chain 🗑️🗑️

- Boltz is going to support on-chain to on-chain asset swap. You can trade your on-chain Bitcoin with on-chain Litecoin, Ethereum, USDT and vice versa.

Privacy Improvements

- ZmnSCPxj, a lightning mailing list OG proposed a novel solution to increase the privacy in our reverse swap protocol.
- In layman's terms: our reverse swap script will look like normal multisig transaction which will result in lower tx fee and better onchain privacy.

Some minor usability improvements

- We will show recommended fee label so as to discourage users from sending on-chain transaction with low fee.
- Support for more Web3 providers.

Merci! 🙏
